BOTTOM LINE

1. **Best pitch: slider (80 Stuff / 75 Results):** 49.7% whiff, .196 xwOBA, 39% usage; 13th-most velo of 197 RHP sliders (90.2 mph); already his 2-strike weapon (50% of 2K pitches).
2. **Elite overall stuff (75):** usage-weighted Stuff +1.00 RV/100, primary FB 97.6 mph (90th pct).
3. **Predictable in 3-1 vs LHH:** 89% four-seams (n=36) — the count a hitter can sit on one pitch.
4. **Platoon gap:** .332 wOBA allowed to LHH vs .238 to the other side (94 pts; 395 / 226 PA vs L / R).
5. **Strong run prevention by xERA:** 2.86 ERA, 3.24 xERA (84th pct), 3.24 FIP, 20.5% K-BB.

SHAPE Movement — four-seam carries 2.9 in more IVB than the average RHP four-seam

Dots = individual pitches (≤110 per type); large markers = his averages; dashed ellipses = league 1-SD shape for the same pitch type from RHPs. Inches, catcher view.

LOCATION Location — 57% of his four-seams finish in the upper third or above

Smoothed density of pitch locations (catcher view; box = average rule-book zone, thirds marked). Darker = more frequent (frequency, not quality) · edge = within ±3 in of the zone border.

COUNTS Count strategy — most predictable in 3-1 vs LHH (89% four-seam)

Throws most = his most-used pitch in each count (tint: red = mixed, blue = ≥70% one pitch, i.e. predictable). Model pick = lowest expected xwOBA from the situational model vs a league-average hitter (◆ = differs). Mix gap = his actual mix's model xwOBA minus the model pick's, in points (.001); blue = larger opportunity.

DEVELOP Development notes — usage direction from the arsenal optimizer

Constrained optimizer on the outcome model (each pitch ±15 pts, 3–55% bounds). Expected gains are small and model-dependent: hypotheses for the pitching staff, not prescriptions.

vs LHH: SL 35→50%, FF 57→47%, CH 8→3% (model xwOBA -2 pts, n=1652)
vs RHH: FF 53→45%, SL 47→55% (model xwOBA -1 pts, n=904)

Grades. each scale is a z-score composite converted to a percentile within the qualified pool, then 50 + 10·Φ⁻¹(p), clipped 20–80 and shown to the nearest 5. Pitch grades are within the same pitch type and throwing hand (≥100 pitches). Stuff = a gradient-boosted model of expected, count-neutral run value from velo, movement, spin, extension, release, arm angle and separation from the primary fastball (no location or results; held-out pitch-type correlation r=0.36). Results = whiff%, CSW%, xwOBA. Command = edge%, waste%, heart% (pitch) and BB%, edge, zone, first-strike (overall). Durability = IP/start, pitches/game, late-game velo hold (relievers: G, IP). **Models.** count plan = situational pitch-type model (2026, generic league-average hitter, medium leverage, 2nd time through); location/tunneling from Statcast trajectory fits at a 23.8 ft decision point; usage suggestion = constrained arsenal optimizer (±15 pts/pitch). Model gaps are small effects — treat as direction. **Caveats.** single season, regular season only; small-sample cells greyed; xwOBA ignores park and defense; IL dates from MLB transactions (retroactive dates honored).
