BOTTOM LINE

1. **Predictable in 3-1 vs LHH:** 79% four-seams (n=39) — the count a hitter can sit on one pitch.
2. **Opportunity in 3-2 vs LHH:** throws four-seam 61%; the situational model prefers sweeper (.314 vs .332 expected xwOBA, n=94).
3. **Tunnel pair FF/SL:** 2.8 in apart at the decision point, 15.8 in at the plate (5.7× late separation).
4. **Fades third time through:** xwOBA .283 first time vs .320 third+ (+37 pts).
5. **Average run prevention by xERA:** 4.51 ERA, 4.02 xERA (52nd pct), 3.74 FIP, 18.3% K-BB.

SHAPE Movement — four-seam carries 1.3 in more IVB than the average RHP four-seam

Dots = individual pitches (≤110 per type); large markers = his averages; dashed ellipses = league 1-SD shape for the same pitch type from RHPs. Inches, catcher view.

LOCATION Location — 35% of his four-seams finish in the upper third or above

Smoothed density of pitch locations (catcher view; box = average rule-book zone, thirds marked). Darker = more frequent (frequency, not quality) · edge = within ±3 in of the zone border.

COUNTS Count strategy — most predictable in 3-1 vs LHH (79% four-seam)

Throws most = his most-used pitch in each count (tint: red = mixed, blue = ≥70% one pitch, i.e. predictable). Model pick = lowest expected xwOBA from the situational model vs a league-average hitter (◆ = differs). Mix gap = his actual mix's model xwOBA minus the model pick's, in points (.001); blue = larger opportunity.

SEQUENCE Sequencing — FF/SL is the best tunnel pair (5.7× separation after the decision point)

Share (%) of next pitch within the same PA, by previous pitch. Tunnel = mean trajectories 23.8 ft from the plate vs at the plate.

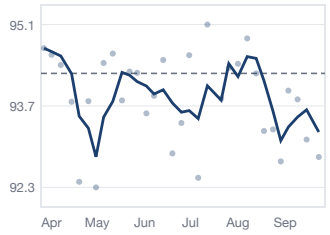

AFTER ↓ / NEXT →	FF	FS	SL
FF n=1104	50	40	7
FS n=890	49	47	3
SL n=204	49	32	19

Best tunnel: **FF/SL** — 2.8 in apart at the decision point, 15.8 in apart at the plate (5.7× late separation; release 2.1 in apart)
Splitter after SL: **54% whiff** vs 42% overall (39 swings)
Slider after FF: **37% whiff** vs 35% overall (35 swings)

DEVELOP Development notes — usage direction from the arsenal optimizer

Constrained optimizer on the outcome model (each pitch ±15 pts, 3–55% bounds). Expected gains are small and model-dependent: hypotheses for the pitching staff, not prescriptions.

vs LHH: FF 52→41%, FS 45→55% (model xwOBA -4 pts, n=1710)
vs RHH: FF 50→35%, FS 33→48% (model xwOBA -5 pts, n=1267)
Shape: his splitter grades 45 Stuff. Top-quartile RHP splitters average 9.7 in of arm-side break vs his 13.9 — the largest gap; worth a look in pitch design, not a prescription.

Grades. each scale is a z-score composite converted to a percentile within the qualified pool, then 50 + 10·Φ⁻¹(p), clipped 20–80 and shown to the nearest 5. Pitch grades are within the same pitch type and throwing hand (≥100 pitches). Stuff = a gradient-boosted model of expected, count-neutral run value from velo, movement, spin, extension, release, arm angle and separation from the primary fastball (no location or results; held-out pitch-type correlation r=0.36). Results = whiff%, CSW%, xwOBA. Command = edge%, waste%, heart% (pitch) and BB%, edge, zone, first-strike (overall). Durability = IP/start, pitches/game, late-game velo hold (relievers: G, IP). **Models.** count plan = situational pitch-type model (2026, generic league-average hitter, medium leverage, 2nd time through); location/tunneling from Statcast trajectory fits at a 23.8 ft decision point; usage suggestion = constrained arsenal optimizer (±15 pts/pitch). Model gaps are small effects — treat as direction. **Caveats.** single season, regular season only; small-sample cells greyed; xwOBA ignores park and defense; IL dates from MLB transactions (retroactive dates honored).
