BOTTOM LINE

1. **Opportunity in 1-1 vs LHH:** throws changeup 30%; the situational model prefers sweeper (.267 vs .282 expected xwOBA, n=148).
2. **Tunnel pair SI/FF:** 3.2 in apart at the decision point, 9.5 in at the plate (2.9× late separation).
3. **Predictable in 1-0 vs RHH:** 63% sinkers (n=95) — the count a hitter can sit on one pitch.
4. **Average run prevention by xERA:** 4.31 ERA, 4.08 xERA (50th pct), 3.45 FIP, 13.9% K-BB.

SHAPE Movement — sinker carries 7.5 in less IVB than the average RHP sinker

Dots = individual pitches (≤110 per type); large markers = his averages; dashed ellipses = league 1-SD shape for the same pitch type from RHPs. Inches, catcher view.

LOCATION Location — 29% of his sinkers finish in the upper third or above

Smoothed density of pitch locations (catcher view; box = average rule-book zone, thirds marked). Darker = more frequent (frequency, not quality) · edge = within ±3 in of the zone border.

COUNTS Count strategy — most predictable in 1-0 vs RHH (63% sinker)

Throws most = his most-used pitch in each count (tint: red = mixed, blue = ≥70% one pitch, i.e. predictable). Model pick = lowest expected xwOBA from the situational model vs a league-average hitter (◆ = differs). Mix gap = his actual mix's model xwOBA minus the model pick's, in points (.001); blue = larger opportunity.

DEVELOP Development notes — usage direction from the arsenal optimizer

Constrained optimizer on the outcome model (each pitch ±15 pts, 3–55% bounds). Expected gains are small and model-dependent: hypotheses for the pitching staff, not prescriptions.

vs LHH: CH 28→43%, SI 21→6%, ST 22→37% (model xwOBA -7 pts, n=1496)
vs RHH: CH 17→32%, ST 18→33%, SI 42→29% (model xwOBA -5 pts, n=992)
Shape: his four-seam grades 40 Stuff. Top-quartile RHP four-seams average 16.8 in of induced vertical break vs his 9.9 — the largest gap; worth a look in pitch design, not a prescription.

Grades. each scale is a z-score composite converted to a percentile within the qualified pool, then 50 + 10·Φ⁻¹(p), clipped 20–80 and shown to the nearest 5. Pitch grades are within the same pitch type and throwing hand (≥100 pitches). Stuff = a gradient-boosted model of expected, count-neutral run value from velo, movement, spin, extension, release, arm angle and separation from the primary fastball (no location or results; held-out pitch-type correlation r=0.36). Results = whiff%, CSW%, xwOBA. Command = edge%, waste%, heart% (pitch) and BB%, edge, zone, first-strike (overall). Durability = IP/start, pitches/game, late-game velo hold (relievers: G, IP). **Models.** count plan = situational pitch-type model (2026, generic league-average hitter, medium leverage, 2nd time through); location/tunneling from Statcast trajectory fits at a 23.8 ft decision point; usage suggestion = constrained arsenal optimizer (±15 pts/pitch). Model gaps are small effects — treat as direction. **Caveats.** single season, regular season only; small-sample cells greyed; xwOBA ignores park and defense; IL dates from MLB transactions (retroactive dates honored).
