BOTTOM LINE

1. **Strong run prevention by xERA:** 3.82 ERA, 3.28 xERA (83rd pct), 3.33 FIP, 21.2% K-BB.
2. **Best pitch: four-seam (50 Stuff / 65 Results):** 27.1% whiff, .290 xwOBA, 41% usage.
3. **Tunnel pair FS/SL:** 1.4 in apart at the decision point, 10.2 in at the plate (7.1× late separation).
4. **Opportunity in 0-0 vs LHH:** throws four-seam 42%; the situational model prefers slider (.249 vs .263 expected xwOBA, n=414).

SHAPE Movement — four-seam carries 2.6 in less IVB than the average RHP four-seam

Dots = individual pitches (≤110 per type); large markers = his averages; dashed ellipses = league 1-SD shape for the same pitch type from RHPs. Inches, catcher view.

LOCATION Location — 71% of his four-seams finish in the upper third or above

Smoothed density of pitch locations (catcher view; box = average rule-book zone, thirds marked). Darker = more frequent (frequency, not quality) · edge = within ±3 in of the zone border.

COUNTS Count strategy — most predictable in 3-1 vs LHH (56% four-seam)

Throws most = his most-used pitch in each count (tint: red = mixed, blue = ≥70% one pitch, i.e. predictable). Model pick = lowest expected xwOBA from the situational model vs a league-average hitter (◆ = differs). Mix gap = his actual mix's model xwOBA minus the model pick's, in points (.001); blue = larger opportunity.

DEVELOP Development notes — usage direction from the arsenal optimizer

Constrained optimizer on the outcome model (each pitch ±15 pts, 3–55% bounds). Expected gains are small and model-dependent: hypotheses for the pitching staff, not prescriptions.

vs LHH: SL 8→23%, ST 8→23%, FF 45→30% (model xwOBA -4 pts, n=1688)
vs RHH: FF 35→20%, ST 27→42%, SL 9→24% (model xwOBA -3 pts, n=1192)
Shape: his changeup grades 45 Stuff. Top-quartile RHP changeups average 9.4 in of vertical separation from the fastball vs his 6.5 — the largest gap; worth a look in pitch design, not a prescription.

Grades. each scale is a z-score composite converted to a percentile within the qualified pool, then 50 + 10·Φ⁻¹(p), clipped 20–80 and shown to the nearest 5. Pitch grades are within the same pitch type and throwing hand (≥100 pitches). Stuff = a gradient-boosted model of expected, count-neutral run value from velo, movement, spin, extension, release, arm angle and separation from the primary fastball (no location or results; held-out pitch-type correlation r=0.36). Results = whiff%, CSW%, xwOBA. Command = edge%, waste%, heart% (pitch) and BB%, edge, zone, first-strike (overall). Durability = IP/start, pitches/game, late-game velo hold (relievers: G, IP). **Models.** count plan = situational pitch-type model (2026, generic league-average hitter, medium leverage, 2nd time through); location/tunneling from Statcast trajectory fits at a 23.8 ft decision point; usage suggestion = constrained arsenal optimizer (±15 pts/pitch). Model gaps are small effects — treat as direction. **Caveats.** single season, regular season only; small-sample cells greyed; xwOBA ignores park and defense; IL dates from MLB transactions (retroactive dates honored).
